

## What makes it good/bad?

The first solution, from the bottom, seems pretty solid and I believe is very efficient since it doesn't seem to iterate more than what's necessary as of contrast to a linear approach.

The second solution is the built-in method from the Arrays class so I can't really comment on that one.

## Did you need help, with what?

Yes. I wasn't aware of the term before giving this assignment so I had to search for examples to fully understand it.

## Was it easy or hard?

Leaning towards harder due to not having spent much time doing algorithms.

## Did you do any improvements to anything?

No.
